

Task 55: Find the Town Judge

Problem Description

In a town, there are n people labeled from 1 to n . There is a rumor that one of these people is secretly the town judge. If the town judge exists, then:

1. The town judge trusts nobody.
2. Everybody (except for the town judge) trusts the town judge.
3. There is exactly one person that satisfies properties 1 and 2.

You are given an array `trust` where `trust[i] = [ai, bi]` representing that the person labeled `ai` trusts the person labeled `bi`. Return the label of the town judge if the town judge exists and can be identified, or return -1 otherwise.

Java Solution

```
class Solution {
    public int findJudge(int n, int[][] trust) {
        int[] trustCounts = new int[n + 1];

        for (int[] relation : trust) {
            trustCounts[relation[0]]--;
            trustCounts[relation[1]]++;
        }

        for (int i = 1; i <= n; i++) {
            if (trustCounts[i] == n - 1) {
                return i;
            }
        }

        return -1;
    }
}
```
